

## **Case Study**

As in pharmacy multiple products sold out from pharmacy stock and multiple products add in stocks in daily basis. We want to keep record of all those products that are sold out and that are new added. There should be an interface on which there is a search bar product name and can add it in bill by entering their quantity and total price of product according to their quantity automatically calculate and, in this way, can add multiple products on same bill and print of that bill will be out from printer. And all these record of sale products should save in computer.

And there is also an interface on which there is a search bar for search products and can view total quantity of that product in stock, purchase price, sale price of product, quantity which sale until now. And an interface for products orders. In that interface there is a search bar on which I can search order company name and in data table color of that products will change and in table show product quantity in stock, price, sold quantity and information like that.

Pdf reports from data in which show the profit/loss on daily basis, weekly and monthly. Product which sold more, and which product generate more profit etc. These reports only view admin of system.

## **Features**

Login Screen for admin and local users

### **Features for Admin**

- Manage Users
